

This is a simplified flowchart presentation of a CAD/CAM software customization. It can be used to determine the steps needed for developing and implementing an in-house application.

The purpose of the Test Plan & Test Data creation is to validate that if the in-house application is updated, the output remains the same. This can be achieved by running the updated application in the test environment against the test data with known outcome.

Note that using and customizing the standard functionality without additional software development is often the most cost-effective solution.
